Fig 1 Design: split, selection rule, and the two gains

one of five frozen analysis splits (seeds fixed before the revised run)

Selection: argmax of the validation C−index over the candidate pool (reference allowed)

Gv = Cv(selected) − Cv(reference) validation gain

Gt = Ct(selected) − Ct(reference) held−out test gain

Orel = Gv − Gt reference−adjusted selection optimism

Notes: (i) block widths are proportional to the sample fractions;

(ii) Ct is a held−out test estimate, not a known truth; (iii) the reference is a fixed Lasso unless stated otherwise.
